## Gunn 50 Overdrive / Master Volume

R44/45 connected as short as possible to sockets to avoid RF interference  
never use power valves without these resistors  
always put in low impedance cathode resistors  
High gain V1 is heated with DC by using the 7812 circuit

### Note:

This circuitry is still not a recommended schematic for a good tube amp, even when it is only altered to make more safe to operate only.
